Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIA1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIA1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian pancreatic cancer or malignant glioma. The present sequence is udes in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·.
                                                                                                                                                                                                                                                The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAI gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAI gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, phonoreatic or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, the patient of the patient of the such as colorectal and the patient sequence is udes in
                                                                                                                                                Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UCT1A1 gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGT1A1 gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            irinotecan; colorectal cancer; cervical cancer; gastric cancer;

colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDRI) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Assian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lung cancer; ovarian cancer; pancreatic cancer; malignant glioma;

The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance ! (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidarug resistance I (WDR1) polymoclectide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; multidrug resistance 1; MDR1; cytostatic; ds; human; UGT1A1; MRP1; TOP1.

The polynucleotides are used for production of recombinant protein, particularly in eukaryotic cells for research and therapeutic applications. The method is also used for identifying expression augmenting sequence elements e.g. from other transformed cell lines. High present sequence is a reverse transcriptase (RT)-PCR primer used to isolate the hamster HMG-I(Y) cDNA.
                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated polynucleotide comprising a nucleic acid molecule comprising nucleotides 11538-11692, nucleotides 11538-1170, nucleotides 11673-12165, nucleotides 11813-12165 or nucleotides 11899-12165 of ADD89798, the hamster high mobility group, HWG-I(Y) gene, fragments of the DNA having expression augmenting activity (an expression augmenting sequence element, EASE) or their combinations or complementary DNA. Also included are a mammalian host cell which comprises the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          short interfering nucleic acid; siNA; downregulation; inhibition; SCD; stearcyl-CoA desaturase; RNA interference; anorectic; antidiabetic; antiarteriosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening;

                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearcyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of SCD kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity, diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacognomics;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          short interfering nucleic acid; siNA; downregulation; inhibition; SCD;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            stearoyl-CoA desaturase; RNA interference; anorectic; antidiabetic; antiatreriosclerotic; cytostatic; virucide; obesity; diabetes; atherosclerosis; cancer; viral infection; drug screening; genetic enginearing; pharmacogenomic; gene mapping; ss.
                                                                                                                                                                                                                                                                  diagnosis of obesity or diabetes, downregulates expression of the stearcyl-CoA desaturase gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADE27228;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 1448
```

```
nucleic acid (siNA) that downregalates expression of the vascular and nucleic acid (siNA) that downregalates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antiangiogenic, cytostatic, nephrotropic and gynaecological, antiarthritic, antipsoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating useful for treating wide range of angiogeness rassociated conditions, particularly cancers, diabetic retinopathy, macular degeneration, and polycystic kidney disease. The siNA may also be useful for diagnosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, druging studying gene function, and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA; downregulation; vascular endothelial growth factor receptor; VEGFR; antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma;
                                                                                                                                                                                                                                                                                                                                                                                                                      New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth factor receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a double-stranded short interfering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human VEGFR3 short interfering nucleic acid (sinA) SEQ ID NO:1792.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.8%; Score 13.8; DB 1; Length 19; 16.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of the SCD (stearoyl-CoA desaturase) gene by RNA interference. Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of StD sins fits for in vitro or in vivo delivery of siNA, (3) conjugates and/or complexes of siNA, and (4) vectors that express siNA. SCD inhibiting siNAs have ancrectic, antidiabetto, antiatreriosclerotic, crytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obesity, diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target studying gene function and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human VEGFR3 short interfering nucleic acid (siNA) SEQ ID NO:1545.
                                                                                                                                                                                                                                                                                    New short interfering nucleic acid, useful e.g. for treatment and diagnosis of obesity or diabetes, downregulates expression of the stearoyl-CoA desaturase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

```
nucleic acid (siNN) that downregulates expression of the vascular candchelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antiangiogenic, cytostatic, antidiabetic, ophthalmological, antiathritic, antigoriatic, nephrotropic and gynaecological, antiathritic, antigoriatic, nephrotropic and gynaecological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, particularly cancers, diabetic retinopathy, macular degeneration, and polycystic kidney disease. The siNA may also be useful for diagnosis, and polycystic kidney disease. The sinA may also be useful for diagnosis, chung screening, target identification and validation, genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (e.g. o

The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms teagen, by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restenosis and polycystic kidney disease), inflammatory and/or allergic diseases, autoimmune diseases and adaptosis, therapeutic target identification and validation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer , downregulates expression of the insulin-like growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human insulin-like growth factor 1 receptor (IGF-IR) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide Specifically, the siNAs include short interfering RNA (siRNA), doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human IGF-1R-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              genetic engineering, pharmacogenomics, studying gene function, and gene

further comprises eachse and antisense regions, or alternatively are assembled from a sense oligomoclectide and an antisense oligomoclectide and an antisense oligomoclectide. Specifically, the sinAs include short interfering RNA (siRNA), doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain decoxyribomoclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the IGF-IR gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the transmittery of a variety of conditions. They may be used for treating cancer and other proliferative diseases (e.g., restenosis and polycystic kidney disease), inflammatory and/or allergic diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer , downregulates expression of the insulin-like growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human IGF-1R transcript target sequence/siNA upper strand, SEQ ID NO:93.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to short interfering nucleic acids (siNA) which downrequiate expression of the human insulin-like growth factor 1 receptor (IGF-1R) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short interfering RNA; shRNA; expression modulation; gene therapy; and arrows a screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; cancer; proliferative disease; restenosis; polycystic kidney disease; inflammatory disease; allergic disease; autoimmune disease; transplant rejection; cytostatic; vasotropic; nephrotropic; antiinflammatory; antiallergic; immunosuppressive; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     insulin-like growth factor 1 receptor; IGF-1R; target sequence; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 3; SEQ ID NO 93; 147pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to human phenotype-associated (PA) genes (I ApP13JOY-ADF13JS86) which contain a Single Nucleotide Polymorphism (SNP). The SNP is given in the sequence as a variant nucleotide. Also claimed are methods for screening for agents which regulate the activity of a PA Polypeptide or a polynucleotide where the reagent is identified by the screening methods. The methods and compositions of the present invention are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for prognosticating, diagnosing and treating cardiovascular diseases, such as atherosclerosis, hypertension, restenosis, arterial inflammation, myocardial infarction and stroke. The present sequence is a PCR primer, used in the examples from the invention.
                                 genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human IGF-IR-targeted double-stranded siNA, which is identical to the IGF-IR transcript target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cardiant; antiarteriosclerotic; vasotropic; cerebroprotective; hypotensive; gene therapy; human; apolipoprotein C-III; PCR; primer; ss.
diseases and transplant rejection. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation,

The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-vabl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint

The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral omoogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                         New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.8%; Score 13.8; DB 1; Length 19; 38.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint oluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siNNA of the invention demonstrates cycostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates an isolated polymucleotide (I) encoded by a cardiovascular associated (CA) gene, having allelic variation contained in a functional surrounding like full length cDNA for CA gene polypeptide, and with or without the CA gene promoter sequence. (I) is a polymucleotide comprising single nucleotide polymorphisms predicting ardiovascular disease. The polymucleotide are useful for assessing predisposition or susceptibility to a cardiovascular disease, e.g. attherosolerosis, ischemia/reperfusion, hypertension, restenosis, arterial inflammation, myocardial infarction, and stroke. These may also be used to predict personal medication schemes omitting adverse drug reactions, or as probes for detecting genetic polymorphisms and as templates for the recombinant production of normal or variant peptides/polypeptides encoded by the genes. This sequence corresponds to a PCR primer to amplify one of
                                                                                                    New isolated polynucleotides comprising single nucleotide polymorphisms of the cardiovascular gene, useful for assessing predisposition or susceptibility to a cardiovascular disease, e.g. atherosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19 BP; 2 A; 10 C; 2 G; 5 T; 0 U; 0 Other;

The invention describes an isolated polypeptide (I) comprising a cids as given in the specification or a region consisting of 5 or more contiguous amino acids, where the region includes amino acid 6 634 of (S1). Also described are: an isolated polymuclectide (II) comprising a fully defined sequence (S2) of 2405 base pair as given in the specification, or its complement, a polymuclectide (II) comprising a specification, or its complement, a polymuclectide, or a region of 15 or more contiguous nucleotides, the region comprising nucleotide 1904 of (S2); vector, preferably an expression vector (III) comprising (II); a host cell (IV) comprising (II); a chost cell (IV) comprising (II); a chost cell (IV) comprising (II); detecting obesity or obesity.

The lated disorders associated with differential expression of a LIPIN3 polymucleotide comprising a detecting a level of expression of (V), or (VI), or a region of (V) or (VI), where the region is 10 or more concluded and of (V) or (VI), where the region is 10 or more concluded (II); and to (II); a recombinant cell sample; antibodies that specifically bind to (I); a recombinant cell sample; antibodies that specifically bind to (I); a recombinant cell somprising a recombinantly modified (II); and array comprising two or more (II); and identifying an alteration in

New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding vascular endothelial growth factor-C (VEGF-C), useful for treating atherosclerosis, diabetic retinopathy, or inflammatory disorders.

The invention relates to a compound targeted to and which specifically hibridises with a nucleic acid molecule encoding VBGF-C, and inhibits the expression of VBGF-C. The compound, composition and methods are useful for treating a disease or condition associated with VBGF-C, such as a cardiovascular disorder e.g. atherosclerosis or diabetic retinopathy or an autoimmune or inflammatory disorder. They are also useful in research and diagnostics for modulating the expression of VBGF-C. The present sequence represents a human VBGF-C PCR primer.

·,
is useful for detecting a polynucleotide polymorphism associated with obesity. (II) is useful for diagnosing obesity an obesity-related with disorder which involves detecting (I). In (M2), the cell is an adipocyte. The test agent is chosen from antibody, protein, mucleic acid, and small organic molecule. This sequence represents a primer used to identify single nucleotide polymorphisms in the human Lipin3 gene that may be

The PCR primer PV3(5') correspond to an oligomer starting at nucleotide 1501 of human papillomavirus type 16. The primer is used to demonstrate a novel in situ PCR method comprising fixed cells, a subset of PCR reagents and opt. a binding protein for single stranded DNA, or fixed cells, a complete set of PCR reagents and the binding protein. The method is used to perform PCR on cells present in histochemical sections or cytochemical smears, e.g. for biological, forensic or pathological studies. The primer was one of a pair used to amplify papillomavirus DNA from human cervical ancer cells silla. A 449 bp PCR prof. was obtd. by this method whereas multiple primer pairs were needed for the same result using conventional pCR methods. See also AAQ34980-6. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                     Compsn. for in situ polymerase chain reaction on fixed cells - involves preventing reaction until start of thermal cycling, and providing higher sensitivity and selectivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N4-methyl-cytidine; N4-methyl-deoxycytidine; triphosphate; CTP; dCTP; substrate; polymerase; cytosine; oligonucleotide; polynucleotide; sequence analysis; primer extension reaction; PCR; polymerase chain reaction; ampliflication.

deoxycytidine 5'-triphosphare (II) are new. (I) and (II) serve as substrates for RNA and DNA polymerases for incorporation of the N4-(1-4C alky1)-cytosine moiety into oligo- and polymucleotides. They can be used in DNA sequence analysis, primer extension reactions and nucleic acid amplification. To assess the potential for using N4-methyl-dCTP in PCR amplification, reaction mixts. contg. the canonical nucleotide set were compared to mixts. in which dCTP was replaced by the N4-methyl-dCTP in PCR analogue, in a PCR experiment designed to amplify a 293 pp sequence of HPV16 DNA. Using a high-temp. regimen the desired fragment was obtained with the canonical dNTPs, but not with N4-methyl-dCTP, A low-temp. regimen, conducted with dCTP or with N4-methyl-dCTP, A low-temp. regimen, conducted with dCTP or with N4-methyl-dCTP, A low-temp. mixt., cleanly produced identical amts. of the expected fragment as the sole amplification product. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cpds. N4-(1-4C alkyl) cytidine 5'-triphosphate (1) and N4-(1-4C alkyl)-2'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide transport gene, atptr2a, disease-resistance, fungus-resistance, insect-resistance, pathogen-resistance, herbicide-resistance, transgenic plant, crop improvement, polymerase chain reaction, primer,

An upstream primer (AAT05336) starting at base 1975 of the Arabidopsis thaliana peptide transport atptr2a gene (see AAT05334) and a downstream primer (AAT05337) starting at base 2528 were used in RT-PCR to measure the extent of ATPTR2A transcription in plant tissue. A 569 bp fragment of the atptr2a open reading frame is generated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pigment epithelium-derived factor (PEDF) has both neuronotrophic and gliastatic activity, making it useful in cases where neurons die quickly and gliastatic activity, making it useful in cases where neurons die quickly neuroglia tend to proliferate (gliosis), e.g. in CNS cell culture, in neurodegenerative diseases and in CNS injury. The neuronotrophic effect of PEDF is especially useful for enhancing survival of neuronal cell of PEDF is especially useful for enhancing survival of neuronal cell human foetal brain cells and neural retina and photoreceptor cells. The gliastatic activity of PEDF can be applied to inhibiting glial cell proliferation in certain tumours. Antibodies directed against PEDF can be used for inhibiting PEDF activity or in an immunoassay for determining levels of PEDF in fluid, cellular or tissue samples e.g for determining ageing and/or other degenerative diseases. Eight primers (AAT11661-68)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of pigment epithelium derived factor - for enhancing neuronal cell survival and inhibiting glial cell proliferation, useful, e.g. in CNS cell culture or to treat neuro-degenerative diseases.
Plant peptide transport genes - used to increase plant resistance to herbicidal peptide(s), pref. those produced by a plant pathogen.
                                                                                                                                                                                                                                                                                                    Gaps

```

for H chain of Fas specific antibody coding sequence.

(first entry)

```
This sequence represents a primer for the coding sequence for the protein of the invention is a recombinant protein (A), that comprises at least one region corresponding to an immunoglobulin (Ig) variable region which enables the protein to recognise and specifically bind to an artigen, preferably human Fas, and has substantially no more immunogenicity in a human patient than a human antibody. The proteins are useful for treating autoimmune diseases, especially rheumatism (rheumatoid arthritis). (A) is based on a murine monoclonal antibody. As the protein lacks the constant region, it has autibody antibody.
                                                                                       Fas; antibody; human; immunoglobulin; variable region; rheumatism; autoimmune disease; rheumatoid arthritis; therapy; CDR; heavy chain; complementarity determining region; PCR primer; amplify; ss.
                                                                                                                                                                                                                                                                                                                                                                         Anti-Fas recombinant antibodies - useful fidiseases, especially rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                  Example 4; Page 16; 72pp; English.

The results indicated that loss of function of the endogenous Hdh gene resulted in embryonic lethality during early post-implantation development. Transgenic mice can be used as models of
were synthesised base on the CDNA sequence of PEDF and used to amplify fragments of the PEDF gene for later sequencing. Two primers (AAT11661, AAT11662) were used to amplify a 2 kilobase fragment from exon 3 to exon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAT47345-T47374 represent variants of a universal primer sequence (see AAT47344) derived from the bacteriophage vector M13mp18. This sequence can be used as half of the DNA primer of the invention. The primers are used for amplification of a target DNA sequence, and can be used in a multiplex PCR amplification. The primers have the sequence 5'-Xy-3', where X is a sequence that does not hybridise to the target sequence (such as this sequence. The melting temperature of a hybrid between X and the target sequence. The melting temperature of a hybrid between X and the target sequence. The melting temperature of a hybrid between X and the target sequence. The melting temperature of a hybrid between X and the target sequence. The melting temperature of a hybrid between X and the complement (in the absence of other sequences) is 60 degrees C. During early cycles of amplification, products are synthesised that contain the chimeric primers on either end. The primers then serve as high stringency recognition sequences for subsequent rounds of thereby reducing preferential amplification of certain targets. The containing Artification of any integer specific domain. They are used for the simultaneous PCR amplification of multiple Odmain. They are used for the simultaneous PCR amplification of multiple community as particularly useful in high-throughput genetic screening for detecting the presence of multiple defined targets e.g. to detect mutations in genes like the cystic fibrosis transmembrane conductance regulator (CPTR), the Wilms Tumour, and the beta-thalassaemia genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

```
This antisense oligonucleotide is specifically hybridisable with selected DNA or RNA deriving from the puromycin-sensitive aminopeptidase (PSA)-99. This oligonucleotide is used for dignosing conditions associated with PSA expression. The human PSA-99 (875 amino acids) and the murine PSA-99 (920 amino acids) both exhibit PSA activity and can be used to generate anti-CSC amino acids) both exhibit PSA activity and can be used to generate anti-CSC amino acids) both exhibit PSA activity and can be used to generate anti-CSC amino acids) both exhibit PSA activity or departs which act by targeting PSA, for modulating PSA activity or cunction. They can be used to influence proteolytic degradation of endogenous PSA substrates, proliferation rate or viability of cells or to induce apoptosis within cells by inhibiting PSA activity. Agents which can diminish PSA activity in cells, by modulation of the amount of PSA synthesis, may be used in treatment of proliferative diseases, including tumours such as leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                               Isolated protein with puromycin-sensitive aminopeptidase activity - which may be used in treatment of proliferative disorders, including cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                         Sequences shown in AAV33257 to AAV3263 represent primers used for the PCR amplification of the human papillomavirus (HPV) type 16 genome contained in the human cervical cancer cell line SiHa. The invention provides a thermal cycler sample compartment optimised for holding and provides a thermal cycler sample compartment optimised for holding and provides a thermal cycler sample compartment optimised for holding and controlling the temperature of one or more microscopes which facilitates a device (barrier) for protecting a microscope slide from fluid or vapour when the slide is scaled in the device, comprising a plastics material that has high thermal conductivity, and is impervious to fluid or vapour, and is dimensioned so as to receive the slide. The new thermal cycling compartment is useful for performing in situ PCR for detection of target nucleic acid sequences directly from cells fixed onto a microscope slide, used in the field of cell biology, forensic science and clinical, veterinary and plant pathology. The modified heat blocks increase the speed and reliability of in situ PCR performed on microscope slides by accelerating and rendering more uniform the heat transfer which occurs during thermal cycling.

The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis, and drug screening. AAVBS917 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                can also be used for detection, diagnosis and drug screening. AAV85917 to AAV86012 represent PCR primers for obtaining LRP-3 CDNA
                                                                                                                                              New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               changes in mRNA cancer-associated gene

0
fragments which can be used to detect cancer cells in tissue samples or biological fluids. They are detected by monitoring the change in mRNA expression as compared to normal tissue of one or more cancer-associated genes whose cDNA stringently hybridises to the nucleic acid fragments. The change in expression may be an increase or a decrease compared to normal tissue. The mRNA expression may be determined by PCR, Northern blotting or ribonuclease protection assay, or by determining the change in the amount of protein encoded by the gene(s) as compared to normal tissue, for example by using a labelled antibody recognising the protein. Detection of cancer cells for cancer diagnosis, including detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human papillomavirus; HPV; thermal cycling device; ceramic sample plate; biological sample; thermal sensor; heater; cooler; thermal cycling; rapid heat transfer; microscope slide; PCR amplification; hybridisation; target nucleic acid; PCR primer; ss.

AAV69978 to AAV69988 represent antisense oligonucleotides which are specifically hybridisable with a region of a nucleic acid encoding human c-Jun protein. The antisense compound regulates the expression of the c-Jun protein. The present invention also describes antisense oligonucleotides which regulate the c-Fos protein. The antisense oligonucleotides are used for the diagnosis and treatment of diseases or disorders associated with Activating Protein I expression, of which c-Fos and c-Jun are subunits. The antisense oligonucleotides are used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotides regulating Activating Protein 1 subunits - hybridise with c-fos and c-jun mRNA, used for regulating metastasis, cell cycle expression and hyperproliferative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chemotherapeutic agent. They are used to regulate the expression of c-Fos or c-Jun in cells or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to treat an animal with, or being prone to, a hyperproliferative disease

PCR amplification of the Human papillomavirus (HPV) gene contained in the human cervical cancer cell line SiHa. These are used in the course of the invention which provides a thermal cycling device comprising a ceramic sample plate. This device has a ceramic sample plate supporting a flat substrate carrying a biological sample and a thermal sensor, a heater thermally coupled to the plate and a cooler for the substrate. The device cither maintains the temperature of the sample or subjects it to thermal cycling. The thin ceramic plate permits very rapid heat transfer to a sample on a microscope slide and this thermal cycling devise can be used for PCR amplification or hybridisation of target nucleic acid on
```

Thermal device for PCR amplification or hybridisation of target nucleic acid on microscope slide - has ceramic sample plate supporting flat substrate for sample and heater and cooler controlled to maintain or rapidly cycle temperature of sample.

Sequences shown in AAV54677 to AAV54683 represent primers used for the

The invention relates to a vector for plant transformation, comprising a T-DNA with flanking T-DNA borders and also a polynucleotide that prevents the development of plant transformants containing more vector sequences than the T-DNA sequence. The vectors encode toxins that are specific to certain plants, or those which act on membrane systems and /or other cellular structures. Examples of genes include those encoding ribozymes against endogenous RNA transcripts, proteins evoking hypersensitive reactions, and RNA transcripts used for antisense/co- suppression inhibition of gene expression. The polynucleotide sequence contained in the vectors prevents the transfer of DNA sequences beyond the T-DNA borders. This avoids contamination of transgenic plants and/ or transgenic food with vector DNA. Sequences AAX05690-91 represent primers used for the PCR amplification of the barnase open reading frame. This is
                                                                                                                                                                                                                                                                                                                           New vector for plant transformation - useful for producing toxins that are specific to certain plants, or those which act on membrane systems and/or other cellular structures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HIV cofactor inhibitor; HIV infection; CXCR4 gene; CCR5 gene; drug composition; antisense; ss.

Nested primers (see AAV32956-37) were used in a second PCR, to produce an approximately 600 bp product. A 3' fragment was identified by database search, and a full-length sequence (see AAV32932) was produced in vector pLITMUS28:CDK10. The CDK10 protein product (see AAV3893) is used e.g. to identify modulators of cell cycle progression and for treating cancer or immune cell proliferation

Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongoncoccal uretritis, practicitis, cervicities, salpinglitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis.

This invention describes a novel composition comprising a number of
sensor arrays, where each array comprises a unique probe oligonucleotide,
which is the reverse complement of part of a unique target
which is the reverse complement of part of a unique probe oligonucleotide probe oligonucleotides of the arget deletion sequence
oligonucleotides The compositions form a method for characterizing a
sample of target deletion oligonucleotides of the sensor arrays. Such
hybridize with the probe oligonucleotides of the sensor arrays. Such
oligonucleotides characterized by the method form pharmaceutical
compositions that are useful for modulating cellular adhesion or
proliferation, and being active against a eukaryotic pathogen, a human immunodeficiency virus (HIV), or a non-human
retrovirus, a human immunodeficiency virus (HIV), or a non-human
retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
Syncytial Virus or cytomegalovirus (CMV). The compositions enable
characterization of deletion sequences, and quantification of different
species of deletion sequences, and quantification of an anixture
species of deletion sequences, and plantification of an anixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

The invention provides a DNA molecule comprising a sequence of nucleotides encoding an alphalF-subunit of a mammalian retinal calcium channel (RCC), including a human abhalF-subunit, a murine alphalF-subunit and orthologs of the human and murine alphalF-subunits. The RCC gene can orthologs of the human and murine alphalF-subunits. The RCC gene may be used to develop products for diagnostic tests, for incomplete CSMB and risk assessment in affected families. The RCC gene can provide information as to the basic defect in this retinal conditions, which could lead to effective methods for treatment or cure of the disorder. As the associated features of myopia, nystagmus and strabismus frequently observed in patients with incomplete CSMB may be caused by calciumregulated development pathways, identification of the RCC gene may help to elucidate the molecular details of eye development and which may lead to treatment for relatede eye disorders or diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent citis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY3454- AAY35879) can be used nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                      Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Retinal calcium channel, RCC gene, alphalF-subunit, retinal disorder; myopia, nystagmus; strabismus; calcium-regulated development pathway; eye disorder; human; EST; expressed sequence tag; CSNB; PCR primer; ss.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N. B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 327, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the
                                                                                                         Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Serine protease BSSP6, useful in detecting homologs, mutants and polymorphic variants as markers for diagnosis of Alzheimer's disease, epilepsy, cancer, inflammation, infertility and prostate hypertrophy, using blood or other tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BSSP6; serine protease; human; hBSSP6; mouse; mBSSP6; brain; diagnostic marker; antibody; transgenic animal; Alzheimer's disease; epilepsy; cancer; inflammation; infertility; pancreatitis; prostatic hypertrophy; PCR primer; ss.

The invention relates to novel serine proteases designated BSSP6

(AAB11712-B11714), and to nucleic acids encoding them (AAA61763-A61765).

The invention also relates to vectors and transformants comprising BSSP6

nucleic acids; transgenic animals in which the expression level of BSSP6

can be varied; and an mBSSP6 knockout mouse. The invention additionally

can be varied; and an mBSSP6 Anothodies and methods of production of such

antibodies, methods of BSSP6 detection using the antibodies, and the use

of BSSP6 proteins or fragments as diagnostic markers for certain medical

conditions. Nucleotides encoding BSSP6 were initially isolated in a human

brain cDNA library using degenerate PCR primers (AAA6179-A61796) based

on conserved regions of serine proteases. The BSSP6 serine proteases and

nucleotides encoding them are useful in detecting homologues, mutants and

conditions such as Alzheimer's disease. epilepsy, cancer, inflammation,

infertility and prostatic hypertrophy. Sequences AAA61768 and

crepresent PCR primers used in the exemplifications of the invention.

Primers AAA61775-A61784 and AAA61763, AAA61765, while primers AAA61785-

AA1792 were used to isolate and amplify murine BSSP6 cDNA (AAA61764).

Primers AAA61778 were used to construct plasmids used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

presence of a 14-3-3 sigma nucleotide sequence. 14-3-3 sigma is a member of the 14-3-3 protein family and is also known as HME1 or stratifin. 14-3-3 sigma expression is regulated by p53 and exogenous expression of 14-3-3 sigma results in G2 block. The 14-3-3 sigma nucleotide and amino acid sequences are used in the invention to develop agents for the diagnosis, susceptibility determination and treatment of cancer. The amino acid captures can be used in method for suppressing the growth of tumour cells. The 14-3-3 sigma polypeptics can mediate cell cycle arrest upon damage to cellular DNA. 14-3-3 sigma probes can be used for diagnosing, testing susceptibility to or treating cancers and identifying agents for

```

The present invention describes an antisense compound (I) of 8-30 nucleobases, specifically hybridising to, and inhibiting expression of, human jun N-terminal kinase kinase-2 (VKK-2). Also described is a method of inhibiting the expression of human JKK-2 in human cells or tissues, comprising contacting the cells or tissues, with (I), in vitro. (I) has antiinflammatory, cytostatic and antiinfectious activities. (I) is useful

Claim 3; Col 40; 31pp; English.

inflammation and tumor.

for inhibiting the expression of JKK-2 in human cells or tissues and prevents or delays infection, inflammation or tumour formation associated with altered expression of JKK-2. (I) is also useful for detecting the levels of JKK-2 in a sample. The present sequence represents a phosphorothioate antisense oligonucleotide for human JKK-2, from the

fatty acids via a novel quantitative competitive reverse transcriptionCPC (CC-RT-PCR). This assay quantifies the amount of target mRNA in a
sample and may be used for discriminating members of a gene family, such
as the CYP gene family. Organisms containing the target gene are cultured
on an organic substrate which causes upregulation of that gene. The total
RNA is then extracted and mixed with a known amount of competitor RNA,
which is similar to the target mRNA but has fewer nucleotides. RT-PCR
teactions are performed using increasing amounts of competitor RNA and
the point at which the amount of the corresponding target DNA is equal to
the amount of the amount of the corresponding competitor DNA is determined. The CPR and
CVP nucleic acids may be transformed into a suitable host so that the
host overspresses the corresponding proteins. Such host cells will
coverproduce dicarboxylic acids. The dicarboxylic acids thus produced find
spplication as thermoplastics, plasticising agents, lubricants, hydraulic
fluids, agricultural chemicals, pharmaceuticals, dyes, surfactants,
cathesives and fragrances cale production of industrially useful
dicarboxylic acids. Sequences AAA10522-A30543 represent QC-RF-PCR primers

Anti-human Fas humanizing antibody-containing antirheumatic agents

Disclosure; Page 16; 109pp; Japanese.

The present invention relates to antirheumatic agents which comprise as active ingredients an immunoglobulin M (1gM) protein. The 1gM protein does not include a J segment, has apoptosis inducing activity, and consists of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive activity and can be used to treat autoimmune diseases, especially rheumatism. The 1gM molecule used in the invention has human Fas-antigen binding properties. Included in the invention are nucleotide sequences of

ö the IgM light and heavy chains (see AAA78267-A78272) and the corresponding protein sequences (see AAB12913-B12918 and AAB12919), and nucleotide sequences of the humanised anti-human Fas Ig CH11 (see AAA78202-A78206) and protein sequences (see AAB12908-B12910). Also included are anti-human Fas antibody CDR peptides (AAB12902-B12907). Primers specific for the anti-human Fas antibody, light, heavy and kappa chains used in the invention are represented by sequences AAA78213-A7826. Primers used for sequencing the human Ig DNA used in the invention are represented by sequences AAA78213-A78337, while humanised anti-Fas Ig DNA sequencing primers are represented by sequences AAA78212-A78338 and AAA78337. Novel methods for evaluating an organisms response to alcohol used evaluate drug treatment and identifying susceptibility to alcohol.

Example 3; Page 68-69; 98pp; English.

t C

The invention relates the identification of genes whose expression levels are altered by chronic exposure to one or more drugs of abuse (e.g., ethanol, stimulants, opiates). The methods of the invention monitor the response of a cell to a drug of abuse, and comprise contacting the cell with the drug of abuse, and detecting the expression of one or more of 218 expressed sequence tags (ESTs) via the use of probes that specifically hybridise to the ESTs. The methods are used to identify genes whose expression levels are altered by chronic or acute exposure to one or more drugs of abuse. The identification of genes whose regulation is altered in alcohol tolerance and/or addiction provides a valuable tool

of a pituitary trophic hormone gene promoter; (4) identify a human afflicted with a disease, disorder, or condition caused by altered expression of Lhx3 or altered level of binding of Lhx3 to a nucleic acid; and (5) detect a mutation in a Lhx3 allele in a human. The coding region of human Lhx3 has been genomically mapped to the subtelomeric region of human Lhx3 is also known as P-LIM or LIM-3. The present sequence represents a PCR primer used in the amplification of human Lhx3, which is used in an example from the present invention

(I) is used in assays to: (1) detect and quantify the presence and level of expression of Lhx3, Lhx3a or Lhx3b, in a sample; (2) identify a compound that affects expression, the level of expression, or the activity of Lhx3, Lhx3a, or Lhx3b in a cell; (3) identify a compound that affects binding or Lhx3 to nucleic acid or Lhx3 induction
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a l
                                                                                                                                                                                                                                                      norepinephrine transporter (NET), both of which are involved in corepinephrine metabolism; delta-like protein (DEK); and monocyte chemoattractant pepride 1 (MCP-1). These genes are thought to be important targets of ethanol. Primers AAZ59944-Z59945 were used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid encoding mammalian Lhx3 for identifying with a disease, disorder, or condition caused by an altered level expression or binding of Lhx3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lhx3; LIM-3; P-LIM; identification; characterisation; diagnosis; chromosome 9; pituitary disease; subtelomeric region; mutation; pituitary trophic hormone gene promoter; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers (or complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and thair alleles, and to study dog pedigrees. They may also be useful for isolating corresponding human gene sequences e.g. genes
                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Dog; genome; genomic marker; radiation hybrid map; identification; chromosome location; gene marker; polymorphic microsatellite marker; phenotype; behaviour; pedigree; ss.

cubstances (1) containing recombinantly prepared subunits (SU) based on amino acids (aa) comprising: (i) at least two modified SU with one difference; and/or (ii) one or more modified SU with at least two differences; and/or (ii) one or more modified SU with at least two differences; and (iii) (optionally) modified SU. The various SU are combined in a mosaic fashion to form (A) in which (I) can be enapsulated. (A) Are used to deliver (I) specifically to cells, by human immune deficiency virus, tumors and a wide range of inherited of seases such as hemophilia, muscular dystrophy or cystic fibrosis. Composition. SU can be motified to impart a wide variety of selected composition. SU can be modified to impart a wide variety of selected composition. SU can be modified to impart a wide variety of selected composition. SU can be modified to impart a wide variety of selected communogenicity. (A) do not require extensive testing to ensure that they are safe (contrast replication-deficient viruses), also SU can be prepared in very pure form and are easily labeled fluorescently (for quality control or localization). This sequence represents a PCR primer cused in the production of a Listerial monocytogenes listeriolysin LLO variant which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Macrophage migration inhibitory factor; MMIF; antisense; neurological; hyperproliferation; nootropic; antihormonal; immunosuppresive; human; antiinflammatory; cytostatic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transport system for compounds, useful e.g. in gene therapy, comprises mosaic-like assembly of different protein subunits able to encapsulate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                830 Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer work of the full length cDNA easily without any special
                                                                                                                                                                                                                                                                                                                                                                   Human; full length cDNA; cDNA synthesis; oligo-capping; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to antisense oligonucleotides 8-30 nucleotides in length targeted to a nucleic acid molecule encoding macrophage migration inhibitory factor (MMF), where the antisense compound specifically hybridizes with and inhibits the expression of MMIF. The antisense nucleotides are useful for the treatment of a disease or condition associated with MMIF such as neurological, hormonal, immune, inflammatory or hyperproliferative disorder. Sequences AAH21191-268 represent chimeric antisense phosphorothioate oligonucleotides used for inhibition of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine; cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection asthma; infection infection; manne deficiency; phosphorothicate; ss.
                                                                                                                                                                                                                                                                    New antisense compound(s) are useful to inhibit a nucleic acid molecule encoding macrophage migration inhibitory factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.8%; Score 13.8; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                임
```

```
The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory
                                                                                                                                                                                                                                      nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (Pyritch) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antiqens, viral antiqens (e.g. texperviridae, retroviridae and/or orthomyxoviridae), bacterial antiqens (e.g. texpolasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antiqens and/or parasitic antiqens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or fimume deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fascin; regulatory sequence; human; dendritic cell; antiviral; tumor; antibacterial; antifungal; antiparasitic; anti-allergic; neurological; immunomodulatory; apoptotic; expression regulator; vaccine; allergen; Creutzfeld-Jakob disease; Alzheiner's disease; gene therapy; autoimmune disease; transplant rejection; primer; ss.

dendritic cell-specific expression of e.g. antigens, e.g. for vaccination
                                                                                                                                                                                and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ansformed), including transformation in vitro. This sequence represents primer associated with the human fascin gene described in the invention
                                                                                                                                                                                                                                 allergic, neurological, immunomodulatory and apoptotic activity. (A) are used to regulate expression of antigens, immunoregulators, antisense sequences etc. in DC-specific fashion. Recombinant DNA, vectors and host cells that contain (A) are useful: (i) in vaccines against viruses, bacteria, fungi, parasites, umors, allergens and plaques in Creutzfeld-Jakob and Alzheimer's disease; and (ii) for gene therapy of tumors,
                                                                                                                                                                                                                                                                                                                                                                                                                    allergies, infections, autoimmune diseases and transplant rejection. They

ô The present invention relates to a retrovirus of type C morphology, which sediments in a sucrose gradient at a density of 1.16-1.18 g/l. The retrovirus is infectious for canine cells and belongs to the oncovirinae group. The present sequence is a PCR primer for the retrovirus of the present invention. The retrovirus can be included in pharmaceutical compositions or medicaments to treat autonimune diseases, haematopoietic malignancies or malignant tumours, especially in humans. The retrovirus can also be used in gene therapy to introduce a transgene into an animal, The invention provides an agent comprising a pyrone compound or dihydroxy compound of specified formulae given in the specification. The agent is used for correcting gene expression in the specification. The agent is following genes may be corrected: IL-6, IL-10, hemeoxygenase-1, prostaglandin G/H synthase-2, macrophage inflammatory protein-1-alpha, IL-lbeta, TNF alpha, IL-1 receptor, macrophage inflammatory protein-1-alpha, macrophage inflammatory protein-1-beta, liver and activation-regulated chemokine, macrophage inflammatory protein-2-beta, marrix metalloproteinase-9, migration inhibitory factor-related protein-8, lyzozyme, GABA(A) receptor-associated protein, interferon-induced 17-Pyrone, gene therapy; antiinflammatory; gene expression; interleukin; hemeoxygenase-1; prostaglandin G/H synthase-2; RANTES; TNF alpha; p78; marcrophage inflammatory protein; chemokine; growth regulated protein-1; matrix metalloproteinase-9; migration inhibitory factor-related protein; lyzozyme; GABA(A) receptor-associated protein; interferon; SCO homolog-2; transketolase, adenosine A2a receptor, CD37 antigen properdin P factor; G-protein, Nef-associated factor-1; signal peptidase; PCR primer; ss. for correcting gene expression regulation error comprises pyrone Gaps Human GABA(A) receptor-associated protein specific primer GABArp-R. ô DB 1; Length 20; Indels Kato Sequence 20 BP; 3 A; 12 C; 2 G; 3 T; 0 U; 0 Other; 2; Sagawa H, 1e+03; Score 13.8; DE Pred. The amplified sequence was used to express fusion proteins comprising a heavy chain variable region of an antibody isolated from llama, which was immunised with Malassezia furfur. M. furfur has been implicated in dandruff formation. The heavy chain variable region is conjugated to an active agent, and used to produce a composition for topical application, as shampoos and conditioners, skin care lotions, shower gels, etc., is useful for targeting an active agent to a site at which M. furfur is present for the treatment and prevention of dandruff hurfur is

Polymorleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression of esirable to decrease or block expression of a particular IL4Ralpha protein isoform, an expression of sisogene, which may be administered to the patient. It may isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a PCR primer for human IL4R-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The nucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing in a patient's genome that affect the activity of gene 216 by expressing in a control or complement or to supplement the patients own production of Gene 216 proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the mucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be in need of restorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 and in assays to identify modulators of Gene 216 expression and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic agents for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assay or EUISA). Disorders that may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease.
              Human, Gene 216; chromosome 20p13-p12; antiasthmatic; anorectic; antiinflammatory; gastrointestinal; gene therapy; vaccine; asthma; obesity; inflammatory bowel disease; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 4 A; 4 C; 7 G; 5 T; 0 U; 0 Other;

Life invention telature to landered genes (vene 210) if the invention intelature to landered genes (vene 210) if the intelature of the proteins they encode. The nucleic acids and proteins case may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing in a patient's genome that affect the activity of gene 216 by expressing contactive proteins or to supplement the patients own production of Gene 216 proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids and complementary sequences may also be used as DNA probes in need of restorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies against Gene 216 and in assays to identify modulators of Gene 216 expression and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic appropriate and presence of Gene 216 proteins in samples (e.g. by enzyme linke defining tassay or ELISA). Disorders that may be proposed and/or events above method in an and/or events.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated genes (Gene 216) from human chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   prevented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present sequence is that of a Gene 216 related primer used in examples of the invention. The primers are used in the physical mapping of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (ABZ72067-ABZ72088), polymorphism identifiction using single strand conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184), sequencing (ABZ72185-ABZ72268) and genotyping (ABZ72317-ABZ72362)

The present invention relates to a screening method for compounds for their ability to modify the binding of G-protein coupled receptor (GPCR) protein ZAQI and related proteins (human ZAQI, rat ZAQI (KZAQI), rZAQZ, human and mouse ISE (mISE) receptor, and mouse GPR73) to receptor protein and ligand are contacted in the presence or absence of the rest compound. The compounds are useful in a drug composition for the treatment, and prevention of digestive and central nervous system (CNS) disorders, including bowel inflammation, diarrhoea, constipation, food absorption disorders, Alzheimer's disease, Parkinson's disease and schizophrenia. The present sequence represents a PCR primer used in the
                                                                                                          G-protein coupled receptor; GPCR; ZAQ; human; ZAQC; ZAQT; rat; ZAQ1; rZAQ1; rZAQ2; mouse; 15E receptor; m15E; GPR73; Bv8 protein; digestive disorder; central nervous system disorder; CNS; diarrhoea; bowel inflammation; constipation; food absorption disorder; nootropic; Alzheimer's disease; Parkinson's disease; schizophrenia; laxative; antiinflammatory; antidiarrhoeic; neuroleptic; neuroprotective; PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Screening of compounds modifying the binding of G-protein coupled receptor protein ZAQ and related proteins to their ligands for use in treatment and diagnosis of digestive disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primer PV3 used to amplify HPV in human cervical cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.8%; Score 13.8; DB 1; Length 20; 88.2%; Pred. The sequence represents PCR primer PV3. The primer was used in the invention to amplify DNA from cells of the stable human cervical cancer cell line SiHa. containing on integrated copy of human papilloma virus (HPV) type 16 per human genome. The invention relates to a novel thermal cycling device for regulating the temperature of a biological sample on a flat substrate. The invention also includes an apparatus comprising the flat substrate for use in the thermal cycling device. The invention is useful for medical diagnosis of diseases such as AIDS, also for amplification of nucleic acids in biological samples. The invention has the advantage that it enhances operatively as the heat resisting element is directly coupled to the microscopic slide, and reduces costs as the use of a heat sink is eliminated. (Updated on 07-AUG-2003 to correct OS
                                                                                                                                                                                                                                                                                                                   Microscopic slide temperature control apparatus for medical diagnosis comprises coupling resistive heating element between the connection pads

The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SACI expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SACI. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SACI predisposition to diabetes, obsesty and/or alcoholism and may provide a diagnostic mark. The polynucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and mouse SACI polypeptides and PCR primers specific for the SCAI genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; Talin, antimicrobial; antiinflammatory; cytostatic; inhibitor; antisense gene therapy; infection; inflammation; Talin inhibitor; tumour; antisense oligonucleotide; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound useful for inhibiting expression of Talin and for preventing or delaying infection, inflammation or tumor formation.
with altered preference for carbohydrates, other sweeteners or ethanol.

                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of rice lesion formation inhibitor Sp17. The protein improves the heat stress of the plant, and can be used in the development of new breeds of plants for agriculture and horriculture. The present sequence is a PCR primer used to isolate the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated polypeptide comprising variant form of mouse or human SACI polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism.
                                                                                                                                                            ALICE-Originated gene, Sp17, that inhibits lesion formation and is applicable in improving heat stress of plants thus leading to prevention of lesion formation, for developing new breeds of plants for agriculture and horticulture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; mouse; SAC1; carbohydrate; sweetener; ethanol; alcoholism; ss;

The present invention describes an antisense compound (I), 16 to 30 bases in length targeted to specific base regions of a nucleic acid encoding human Talin. Also described: (a) an antisense compound up to 30 bases in length which inhibits the expression of human Talin; (b) a composition (II) comprising (I) or (a); and (c) inhibiting the expression of human tissues in human cells or tissues comprising contacting the cells or tissues in vitro with (I) or (a). (I) has antimicrobial, antiinflammatory and cytostatic activities, and can be used in antisense gene therapy and as a Talin expression inhibitor. (I) can be used: to inhibit the expression of human Talin in human cells or tissues; to prevent or delay
                                                                                                                                                                                                                                                                                                                                                                                              infection, inflammation or tumour formation; and in diagnostics, therapeutics, prophylaxis, and in research reagents and kits. The present sequence represents a human Talin antisense chimeric phosphorothioate oligonucleotide, having 2'-methoxyethyl (2'-MOE) wings of 5 nucleotides at the 5' and 3' ends and a 10 nucleotide deoxy gap in the middle, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 5 A; 7 C; 4 G; 4 T; 0 U; 0 Other;

included is a kit comprising a first container housing the antiangiogenic mucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, who magnation and the present seminary and the present seminant and the present seminary and the present s

Set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19, useful, for e.g. detecting statistical correlations between marker allele and a phenotype

Disclosure; Page 307; 311pp; English.

The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disease involving drug responses, obesity or disorders related to obesity, such as hyperunicaemia, digestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insulficiency. The markers are useful for detecting a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                DP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a map of the bread wheat D genome comprising the genome location of a microsatellite marker selected from a group of 185 such markers (ABQ921918-148092917). The invention also encompasses the use of left (ABQ921918-148092917). The invention also encompasses the use of left (ABQ921918-148092917). The invention also encompasses the use of left (ABQ92108-148093187) primers to amplify and detect the microsatellite markers, and to identify genes responsible for a phenotypic trait of interest in wheat. Wheat is an allohexaploid species consisting of 3 alploid encomes designated A, B and D, resulting from two successive intercrossings involving at least three different species. The D genome is thought to have been introduced in the cost recent intercrossing, between the amphiploid AABB and Triticum tauschii (DD), probably involving only a limited number of genotypes of both species. Due to its polyploid genome, the large size of its genome, and its low level of polymorphism, the genetic mapping of wheat has to between one and six nucleotides long, and are very polymorphic in length, mainly due to polymerase slippage during replication. This high degree of polymorphism makes them especially suitable for the genetic mapping of
                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Map of wheat D genome comprising the genome location of a microsatellite marker, useful for e.g. identifying genes responsible for a desired phenotypic trait, especially quantitative trait loci in wheat, and

Species which show little intraspecies polymorphism, such as wheat. In addition, microsatellites are codominant, and exhibit Mendelian continues and inheritance. The 185 microsatellite markers of the invention are developed from the ancestral diploid donor species Triticum tauschii and map to the wheat D genome, which is less polymorphic than the A or B compones. These microsatellite markers thus help to overcome some of the problems associated with the genetic mapping of wheat. The wheat D genome compones the microsatellite markers and associated primers of the invention are useful for identifying genes responsible for a phenotypic trait of interest, most notably QTDs (quantitative trait loci). In continuar they may be used for analysing genes and alleles implicated in conference and for identifying development factors, quality factors and disease and for identifying development factors, quality factors and cators conferring resistance to pathogens and xenobiotics. The mapping and genotyping diploid and polyphoid species of Triticum cum. Triticum comprises wheat or a related species; for identifying cultivars and hybrids of Triticum and related species; to assess whether or not a product comprises wheat or a related species; to assess whether or not a product comprises wheat or a related species; to assess whether or not a product comprises wheat or a related species; to assess whether or not a microsatellite marker right PCR primer of the invention. (Updated on 29-conference of the invention. (Updated on 29-conference of the invention.)

The present invention relates to the isolation of novel human proteins referred to as NOVX, and the polynucleotide sequences encoding them. The NOVX proteins of the invention include NOV1-NOV13. NOVX proteins, NOVX mucleic acids and antibodies are useful for treating or preventing a NOVX particularly humans. Such disorders include cardiomypathy, atherosclerosis, diabetes, cancer (e.g. adenocarcinoma, lymphoma, processing and metabolic pathways, disorders related to cell signal processing and metabolic pathways, disorders related to cell signal system (e.g. those induced by trauma, surgery and/or neoplastic disorders), acquired immunodeficiency syndrome (AIDS), inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorders (e.g. asthma) obesity, anorexia, cancer-associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, immune disorders, graft versus host disease, Crohn's disease, multiple sclerosis, haemophilia, idiopathic thrombocytopenic purpura, and

The invention relates to an antisense oligonucleotide compound of 8 to 50 nucleotides in length that is targeted to a nucleic acid molecule encoding caspase 6, where the oligonucleotide specifically hybridises with and inhibits the expression of caspase 6. The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered or cissues. The oligonucleotides can be administered or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, a various types of cancer, neurological conditions such as Alzheimer's disease and other deregulated apoptotic pathological conditions. This polynucleotide sequence regulated apoptotic pathological conditions. This polynucleotide sequence regulated amouse caspase 6 oligonucleotide relating to the invention. NOTE: This phosphorothioate oligonucleotide sequence has 2'-MOE wings and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; cytohesin-1; guanine nucleotide exchange protein; ARF; ADP ribosylation factor; inflammation; antiinflammatory; tumour;

                                                                                                               uncleobases targeted to a nucleic acid molecule encoding human cytohesin-
1, specifically hybridises with, and inhibits the expression of, human cytohesin-i, a guanine nucleotide exchange protein for ARF (ADP ribosylation factor). The antisense compound may be used in a pharmaceutical composition for inhibiting the expression of cytohesin-linhuman cells or tissues, and in treating a disease or condition associated with cytohesin-l by administering to the human the antisense compound e.g. tumour or inflammation. The antisense compound is also useful for diagnostics, therapeutics, prophylaxis and as research
preventing or treating a disease or condition associated with cytohesin-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                    reagents and kits. The present sequence is an antisense oligonucleotide

resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent

                                                                                                                                                                                   The present invention relates to antisense compounds, compositions and methods for modulating the expression of MEKK4 (also referred as mitogenactivated protein kinase kinase 4; MAPIZK4; MAPIZKK kinase kinase 4; MAPIZKK, MTK1). The antisense oligos are useful for inhibiting the expression of MEKK4 in cells or tissues. They are also useful for treating an animal having a disease or condition associated with MEKK4 such as immunological, inflammatory, hyperproliferative disorder or cancer. Sequences of the invention are also useful for they are also useful in antisense therapy. The present sequence is an antisense oligomucleotide targetted to human MEKK4 DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; methylated gene; methylation; breast cancer; marker; WT-1; cell proliferative disorder; TWIST; HOXAS; NES-1; RARbeta; cyclin D2; retinoic acid receptor beta; oestrogen receptor; Wilms' tumour; 14.3.3 sigma; HIN-1; RASSF1A; tumour suppressor gene; hypermethylation;

                                                                                                                                                                                                                                                             The present invention relates to a method of diagnosing a cellular proliferative disorder of breast tissue, which involves determining the state of methylation of one or more mucleic acids isolated from the subject, where the state of methylation of the nucleic acids as compared with a state of methylation from a subject not having the cellular proliferative disorder of breast tissue is indicative of a cellular proliferative disorder of breast tissue in the subject. The nucleic acids may be TWIST, HOXAS, NES-1, retinoic acid receptor beta (RARbeta), oestrogen receptor, cyclin D2, Wilms' tumour gene (WT-1), 14.3.3 sigma, HIN-1 or RASSFIA. The method is useful for diagnosing and/or determining a predisposition to a cellular proliferative disorder, in particular breast cancer including ductal carcinoma in situ, lobular carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             colloid carcinoma, tubular carcinoma, medullary carcinoma, metaplastic acarcinoma, intraductal carcinoma in situ, lobular carcinoma in situ and papillary carcinoma in situ. The present sequence is a primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
Diagnosing and/or determining a predisposition to a cellular problemative disorder of breast tissue, in particular breast cancer, by determining the state of methylation of one or more nucleic acids isolated from the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;
